

LABORATORY ASSESSMENT: REFLECTION

In one short paragraph, how did you develop and verify your solution to one quick activity, and how did organizing and committing your files help you document your work?

I developed the solution by completing the activity testing the activity to make sure the solution worked correctly and checking the output to make sure it matched the expected result. I organized the activity files in a folder and used Git to track and commit my changes, which helped keep my work structured and gave a clear record of my progress and the completed solution.
